Example 1: Let's consider a gene with only two alleles. In mice, Black fur color (BB or Bb) is dominant to brown fur color (bb). In a population of 100 mice, 36 mice are homozygous dominant (BB), 48 mice are heterozygous (Bb) and 16 are brown (bb).
Relative frequency of B = $\frac{\# \text{ of B alleles}}{\# \text{ of TOTAL alleles}}$ in the population

Figure 16-1 There are two main sources of genetic variation: mutations and the gene shuffling that results from sexual reproduction. Each of these babies has inherited a collection of traits. Some, such as hair color, are visible, while others, such as the ability to resist certain diseases, are not. Section 16-1 SECTION RESOURCES Print: • Laboratory Manual A, Chapter 16 Lab

Chapter 16 Evolution of Populations 16-1 Genes and Variation Darwin's original ideas can now be understood in genetic terms. Beginning with variation, we now know that traits are controlled by genes and that many genes have at least two forms, or alleles. We also know that individuals of all species are heterozygous for many genes.
