Call a Smeerp a \"Rabbit\": Using taxonomic orders developed by pre-20th century humans to describe animals from 50 million years after man's extinction results in something like this. For example the wakka (ratite-like bipedal grazer), desert leaper (resembling a dromedary but with kangaroo-like hopping motion), and bardelot (polar bear analogue with sabretoothed females) are all classed as rodents even though they're very different from each other and don't always have

After Man: A Zoology of the Future (1981, ISBN 978-0312011635) is a 1981 book by the Scottish geologist and author, Dougal Dixon. In it, he presents his hypothesis on how the fauna and geography could change 50 million years from now.

In 1981 St Martin's Press published *After Man*, the first edition of palaeontologist Dougal Dixon's vision of an 'alternative evolution': one without mankind. To some, this was seen as sacrilege, but Dixon himself only ever saw the decision to obliterate his own species from his vision as a practical one.

The surprising and illuminating look at how Tolkien's love of science and natural history shaped the creation of his Middle Earth, from its flora and fauna to its landscapes. The world J.R.R. Tolkien created is one of the most beloved in all of literature, and continues to capture hearts and imaginations around the world. From Oxford to ComiCon, the Middle Earth is analyzed and interpreted through a multitude of perspectives. But one essential facet of Tolkien and his Middle Earth has been overlooked: science. This great writer, creator of worlds and unforgettable character, and inventor of language was also a scientific autodidact, with an innate interest and grasp of botany, paleontologist and geologist, with additional passions for archeology and chemistry. Tolkien was an acute observer of flora and fauna and mined the minds of his scientific friends about ocean currents and volcanoes. It is these layers science that give his imaginary universe—and the creatures and characters that inhabit it—such concreteness. Within this gorgeously illustrated edition, a range of scientists—from astrophysicists to physicians, botanists to volcanologists—explore Tolkien's novels, poems, and letters to reveal their fascinating scientific roots. A rewarding combination of literary exploration and scientific discovery, *The Science of Middle Earth* reveals the hidden meaning of the Ring's corruption, why Hobbits have big feet, the origins of the Dwarves, the animals which inspired the dragons, and even whether or not an Ent is possible. Enhanced by superb original drawings, this transportive work will delight both Tolkien fans and science lovers and inspire us to view both Middle Earth—and our own world—with fresh eyes.

Everyone wonders what tomorrow holds, but what will the real future look like? Not decades or even hundreds of years from now, but thousands or millions of years into the future. Will our species change radically? Or will we become builders of the next dominant intelligence on Earth- the machine? These and other seemingly fantastic scenarios are the very possible realities explored in Peter Ward's *Future Evolution*, a penetrating look at what might come next in the history of the planet. Looking to the past for clues about the future, Ward describes how the main catalyst for evolutionary change has historically been mass extinction. While many scientists direly predict that humanity will eventually create such a situation, Ward argues that one is already well underway--the extinction of large mammals--and that a new Age of Humanity is coming that will radically revise the diversity of life on Earth. Finally, Ward examines the question of human extinction and reaches the startling conclusion that the likeliest scenario is not our imminent demise but long term survival--perhaps reaching as far as the death of the Sun! Full of Alexis Rockman's breathtaking color images of what animals, plants and other organisms might look like thousands and millions of years from now, *Future Evolution* takes readers on an incredible journey through time from the deep past into the far future.

A companion book to the 2003 Animal Planet series looks at the latest in evolutionary theory, including animals in a post-human world who have adapted to massive climate and geological changes.

The phenomenon of evolution, throughout its present stage, has proceeded spontaneously and by astounding chance by accident. But beginning with the imminent, radical, evolutionary leap, it will have to be engineered and constructed by the very subject of that evolution, ourselves. The present scholarly volume offers a careful and creative consideration of many of the factors comprising the task philosophical (especially), psychological, spiritual, religious, and theological along with

provocative reflections on their nature and prospective realization. The work's original inspiration is in the pioneering groundwork of Pierre Teilhard de Chardin; but then its reflections paint a considerably wider, and to some extent alternative, picture with a set of signposts to pass (after creating them!), along the optimistic, wonderful route that challenges the humanity of today and tomorrow.
