CDC - Onchocerciasis Onchocerciasis, or river blindness, is a neglected tropical disease (NTD) caused by the parasitic worm Onchocerca volvulus. It is transmitted through repeated bites by blackflies of the Page 13/42

genus Simulium.

CDC - Onchocerciasis

Treatment information for onchocerciasis can be found at: https://www.cdc.gov/parasites/onchocerciasis/health_professionals/index.html.

Page 14/42

DPDx is an educational resource designed for health professionals and laboratory scientists. For an overview including prevention, control, and treatment visit www.cdc.gov/parasites/.

CDC - DPDx - Onchocerciasis Onchocerciasis, also known as river blindness, is a disease caused by infection with the parasitic worm Onchocerca volvulus. Symptoms include severe itching, bumps under the Page 16/42

skin, and blindness. It is the second-most common cause of blindness due to infection, after trachoma. The parasite worm is spread by the bites of a black fly of the Simulium type. Usually, many bites are Page 17/42

required before infection occurs. These flies live near rivers, hence the common name of the disease. Once inside a perso

WHO | Epidemiology Onchocerciasis Elimination Programme for the Americas (OEPA) OEPA is a regional partnership which was launched in 1992. Its goal (under the Pan American Page 25/42

Health Organization [PAHO] Directing Council resolutions CD48.R12 and CD49.R19) is to interrupt onchocerciasis transmission in the Region of the Americas by 2015.

WHO | Prevention, control and elimination of onchocerciasis Between 1974 and 2002, onchocerciasis was brought under control in West Africa through the work of the Onchocerciasis Control Page 27/42

Programme (OCP), using mainly the spray of insecticides against blackfly larvae (vector control) by helicopters and airplanes. This was supplemented by large-scale distribution of ivermectin Page 28/42

since 1989.

onchocerciasis
This test is available from
the CDC. It is important to
obtain a definitive
Page 29/42

diagnosis so that appropriate treatment can be started (see treatment section below). Onchocerciasis is a type of filariasis that does not respond well to some other drugs used to treat other Page 30/42

similar filarial diseases. Diethylcarbamazine, a commonly used drug that is a derivative of piperazine, actually has been linked to severe and sometimes fatal patient reactions when used to treat onchocerciasis.
