Cognitive gadgets are products of cultural evolution, rather than genetic evolution. At birth, the minds of human babies are only subtly different from the minds of newborn chimpanzees. We are friendlier, our attention is drawn to different things, and we have a capacity to learn and remember that outstrips the abilities of newborn chimpanzees.

newborn chimpanzees.

**Cognitive Gadgets* - Marginal REVOLUTION*
Cultural innovations in number representations are inextricably linked with cognitive concepts and skills, and their evolution passed through several cycles of cultural exaptation (Fig. 1.3), in which tools and techniques that had been developed to incise objects (e.g., for decorations) were co-opted for the production of an artificial memory system by associating signs with meaning (d'Errico et al., 2017).

be human.”—Lord John Krebs,
University of Oxford

Cognitive Gadgets – Cecilia Heyes | Harvard University Press

Evidence of cultural influences on cognition is accumulating, but untangling these cultural influences from one another or from non-cultural influences has remained a challenging task. As between-group differences are neither a sufficient nor a necessary indicator of cultural impact, cross-cultural comparisons in isolation are unable to furnish any cogent conclusions.
