How To Solve Word Problems Using Proportions? This video shows how to solve word problems by writing a proportion and solving 1. A recipe uses 5 cups of flour for every 2 cups of sugar. If I want to make a recipe using 8 cups of flour, how much sugar do I use? 2. A syrup is made by dissolving 2 cups of sugar in 2/3 cups of boiling water.

Direct & Inverse Proportions (Indirect Proportions) with—

Two quantities existing in direct proportion can be expressed as; $x \propto y$, $x/y = k$, $x = ky$, k is a non-zero constant of proportionality. Where x and y are the value of two quantities and k are a constant known as the constant of proportionality. If x_1 , y_1 is the initial values and x_2 , y_2 are the final values of quantities existing in direct proportion. They can be expressed as,

Solution : This is a situation of direct proportion. Because, more miles \rightarrow more cost. Let x be the no. of miles and y be the cost. Since this is direct proportion, we have $y = kx$. Substitute $x = 15$ and $y = 40.50$. $40.50 = 15k$. $2.7 = k$ Then, $y = 2.7x$. Substitute $x = 20$. $y = 2.7(20)$ $y = 54$. So, the cost for 20 miles is \$54. **Problem 8 :**
