The hardware specification written by hardware engineers with details about the bits and registers forming the hardware/ firmware interface is the most valuable tool for firmware engineers. They have to have this to correctly code up the firmware. Of course, it goes without saying that this specification must be complete and correct.

To get the best mix of hardware and on-screen, digital controls, product developers need to reunite UI design with engineering and industrial design processes  $\square$  ideally within the Design Thinking framework. This requires two major shifts in process thinking: Merge Development Timelines. Bridging the agile development process of UI and the linear stage-gate process of hardware design is challenging, but it can be done by forcing a more iterative process.

Firmware is just a special kind of software that serves a very narrow purpose for a piece of hardware. While you might install and uninstall software on your computer or smartphone on a regular basis, you might only rarely, if ever, update the firmware on a device and you'd probably only do so if asked to by the manufacturer, probably to fix a ...
