The method of lines (MOL, NMOL, NUMOL) is a technique for solving partial differential equations (PDEs) in which all but one dimension is discretized. MOL allows standard, general-purpose methods and software, developed for the numerical integration of ordinary differential equations (ODEs) and differential algebraic equations (DAEs), to be used.

The study on numerical methods for solving partial differential equation will be of immense benefit to the entire mathematics department and other researchers that desire to carry out similar research on the above topic because the study will provide an explicit solution to partial differential equations using numerical methods. The study will determine the norm and error norms in the numerical solution of the PDE.

The partial differential equation takes the form. 
$$Lu = \sum_{\nu=1}^n A_{\nu} \frac{\partial u}{\partial x_{\nu}} + B = 0,$$
 where the coefficient matrices  $A_{\nu}$  and the vector  $B$  may depend upon  $x$  and  $u$ . If a hypersurface  $S$  is given in the implicit form.

In the mathematical subfield of numerical analysis, numerical stability is a generally desirable property of numerical algorithms. The precise definition of stability depends on the context. One is numerical linear algebra and the other is algorithms for solving ordinary and partial differential equations by discrete approximation. In numerical linear algebra the principal concern is ...

Abstract: As further progress in the accurate and efficient computation of coupled partial differential equations (PDEs) becomes increasingly difficult, it has become highly desired to develop new methods for such computation. In deviation from conventional approaches, this short communication paper explores a computational paradigm that couples numerical solutions of PDEs via machine-learning (ML) based methods, together with a preliminary study on the paradigm.

Richardson extrapolation is commonly used within the numerical approximation of partial differential equations to improve certain predictive quantities such as the drag or lift of an airfoil, once these quantities are calculated on a sequence of meshes, but it is not widely used to determine the numerical solution of partial differential equations.
