In statistical inference, we care about using sample data to make statements about “truths” in the larger population. To make causal inferences in the sample, we need to account for all possible confounding variables, or we need to randomize the “treatment” and assure there are no other possible reasons for an observed effect.

This course introduces basic descriptive and inferential statistics using both traditional (normal and t-distribution) and simulation approaches including confidence intervals and hypothesis testing on means (one-sample, two-sample, paired), proportions (one-sample, two-sample), regression and correlation.

from data. There are many modes of performing inference including statistical modeling, data oriented strategies and explicit use of designs and randomization in analyses. Furthermore, there are broad theories (frequentists, Bayesian, likelihood, design based, ...) and numerous complexities (missing data, observed and unobserved confounding, biases) for performing inference.
